EXAMINER
MANNING, JOHN

ART UNIT	PAPER NUMBER
2614	

DATE MAILED: 11/29/2005

Please find below and/or attached an Office communication concerning this application or proceeding.

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE <u>3</u> MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.
- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☐ Responsive to communication(s) filed on _____.

2a)☐ This action is **FINAL**.   2b)☒ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) *1-11* is/are pending in the application.

     4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☒ Claim(s) *1-11* is/are rejected.

7)☐ Claim(s) _____ is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☐ The drawing(s) filed on _____ is/are: a)☐ accepted or b)☐ objected to by the Examiner.

     Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

     Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

     a)☐ All b)☐ Some * c)☐ None of:

       1.☐ Certified copies of the priority documents have been received.

       2.☐ Certified copies of the priority documents have been received in Application No. _____.

       3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

     * See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1)☒ Notice of References Cited (PTO-892)

2)☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)

3)☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
     Paper No(s)/Mail Date _____.

4)☐ Interview Summary (PTO-413)
     Paper No(s)/Mail Date. _____.

5)☐ Notice of Informal Patent Application (PTO-152)

6)☐ Other: _____.

DETAILED ACTION

Response to Arguments

1.   Applicant's arguments with respect to the amended claims have been considered

but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

2.   The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all

obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set
> forth in section 102 of this title, if the differences between the subject matter sought to be patented and
> the prior art are such that the subject matter as a whole would have been obvious at the time the
> invention was made to a person having ordinary skill in the art to which said subject matter pertains.
> Patentability shall not be negatived by the manner in which the invention was made.

3.   Claims 1-11 are rejected under 35 U.S.C. 103(a) as being unpatentable over

Leak et al. (US Pat No 6,182,072) in view of Mao et al. (US Pat No 6,886,178).

In regard to claim 1, the claimed limitation of "an instruction device generating

instruction information to be used to automatically select a plurality of selection items,

described in a language for data broadcasting and included in the content information

from the content information" is met by Figure 4, Items 21-23. The reference discloses

the use of HTML, which can be used in data broadcasting. The "present invention can

be carried out by the CPU 21 executing sequences of instructions contained in memory

(i.e., NVS 22, RAM 23, or a combination thereof). More specifically, execution of the

sequences of instructions causes the CPU 21 to perform the steps of the present

invention. Instructions for carrying out the present invention may be loaded into memory

from a mass storage device" (Col 5, Lines 6-12). The claimed limitation of "an output

device outputting the content information while automatically selecting the plurality of

selection items according to the instruction information" is met by Figure 9 and the client

system 1 of Figure 1. The "client system 1 automatically displays a sequence of Web

pages without requiring the user to enter any input once the tour is initiated" (Col 8,

Lines 27-30). The reference discloses that any communication path may be used.

"Note that modem 27 may be a conventional telephone modem, an ISDN or Ethernet

adapter, or any other suitable data communication device" (Col 4, Lines 43-46).

Leak discloses that any suitable type of data connection may be used (Col 3,

Lines 31-36). Leak fails to disclose a "receiving device...", "a selection device..." or a

"converting unit..." for operation in a digital broadcasting environment. Mao teaches a

"receiving device...", "a selection device..." and a "converting unit..." for operation in a

digital broadcasting environment so as "to support a mass quantity of simultaneous

Internet access requests without requiring an excessive number of simultaneous

telephone connections at the remote Internet web site" (Col 3, Lines 14-17, Also see:

Col 8, Lines 5-67, Col 9, Lines 1-50). Consequently, it would have been obvious to one

of ordinary skill in the art to implement Leak with "receiving device...", "a selection

device..." and a "converting unit..." for operation in a digital broadcasting environment

for the stated advantage.

In regard to claim 2, the claimed limitation of "an analysis device extracting the

plurality of selection items by analyzing the content information" is met by the routine of

Figure 9. The "client system 1 initially receives a Web page (i.e., the top level Web

page). The Web page may be received in response to the user of the client system 1

activating a hypertext link in another Web page, for example. In step 902, the client

system 1 identifies URIs that are referred to by the received Web page. As noted above,

the client system 1 is able to identify URIs based on the tags in an HTML document. In

step 903, the client system 1 uses the identified URIs to request and receive each of the

Web pages that are directly linked to the current Web page (i.e., the second level of

Web pages)" (Col 7, Lines 34-44). The claimed limitation "generating an operational

procedure for selecting the plurality of selection items in a prescribed order" is met by

step 904 of Figure 9. "In step 904, the client system 1 displays these additional Web

pages in a sequence, displaying each Web page for a defined period of time. In one

embodiment, the period of time is defined based on the content of the current Web page

and is therefore variable" (Col 7, Lines 44-48).

In regard to claim 3, the claimed limitation that "if the content information consists

of a plurality of pages, said analysis device analyzes a link between the plurality of

selection items and generates an operational procedure that covers the plurality of

pages, and said instruction device generates instruction information for sequentially

outputting the plurality of pages" is met by Figure 9. "FIG. 9 illustrates an overall routine

for providing a tour of Web pages according to a simple embodiment" (Col 7, Lines 32-

33). "In step 902, the client system 1 identifies URIs that are referred to by the received

Web page. As noted above, the client system 1 is able to identify URIs based on the

tags in an HTML document" (Col 7, Lines 38-41). "In step 903, the client system 1 uses

the identified URIs to request and receive each of the Web pages that are directly linked

to the current Web page (i.e., the second level of Web pages). In step 904, the client

system 1 displays these additional Web pages in a sequence, displaying each Web

page for a defined period of time" (Col 7, Lines 41-46).

In regard to claim 4, the claimed limitation "an extracting device extracting the

operational procedure for selecting the plurality of selection items in a prescribed order

from the content information if the operational procedure is in advance described in the

content information wherein said instruction device generates the instruction information

according to the operational procedure" is met by Figure 8. The HTML web page

contains URLs, which specify another web page. The web pages have a hierarchal

structure as shown in Figure 8. "Each hypertext anchor in an HTML Web page is

associated with a particular URI (Uniform Resource Identifier), which specifies the

location (i.e., logical address) of another Web page or other data. Hypertext anchors

and other displayable objects are identified in an HTML document by a number of

"tags", which specify the attributes of the object, including the associated URI in the

case of hypertext anchors" (Col 6, Lines 58-65). Additionally, "In step 904, the client

system 1 displays these additional Web pages in a sequence, displaying each Web

page for a defined period of time" (Col 7, Lines 44-46).

In regard to claim 5, the claimed limitation of "wherein if the content information

consists of a plurality of pages, said extraction device extracts information about an

operational procedure that is generated by analyzing a link between the plurality of

selection items and that covers the plurality of pages, and said instruction device

generates instruction information for sequentially outputting the plurality of pages" is met

by Figure 8. "Each hypertext anchor in an HTML Web page is associated with a

particular URI (Uniform Resource Identifier), which specifies the location (i.e., logical

address) of another Web page or other data. Hypertext anchors and other displayable

objects are identified in an HTML document by a number of "tags", which specify the

attributes of the object, including the associated URI in the case of hypertext anchors"

(Col 6, Lines 58-65). Additionally, "In step 904, the client system 1 displays these

additional Web pages in a sequence, displaying each Web page for a defined period of

time" (Col 7, Lines 44-46).

In regard to claim 6, the claimed limitation of "a generation device analyzing

content information of data broadcasting in digital broadcasting and generating an

operational procedure for automatically selecting a plurality of selection items included

in the content information" is met by Figure 4, Items 21-23 and the routine of Figure 9.

The "client system 1 automatically displays a sequence of Web pages without requiring

the user to enter any input once the tour is initiated" (Col 8, Lines 27-30). The "client

system 1 initially receives a Web page (i.e., the top level Web page). The Web page

may be received in response to the user of the client system 1 activating a hypertext link

in another Web page, for example. In step 902, the client system 1 identifies URIs that

are referred to by the received Web page. As noted above, the client system 1 is able to

identify URIs based on the tags in an HTML document. In step 903, the client system 1

uses the identified URIs to request and receive each of the Web pages that are directly

linked to the current Web page (i.e., the second level of Web pages)" (Col 7, Lines 34-

44). Additionally, Modem 27 receives the content information. "Note that modem 27

may be a conventional telephone modem, an ISDN or Ethernet adapter, or any other

suitable data communication device" (Col 4, Lines 43-46). The claimed limitations of "a

description device describing information about the operational procedure in the content

information in such a way to output the content information according to the operation

procedure" and "an output device outputting content information in which information

about the operational procedure is described" are met by Figure 8. "Each hypertext

anchor in an HTML Web page is associated with a particular URI (Uniform Resource

Identifier), which specifies the location (i.e., logical address) of another Web page or

other data. Hypertext anchors and other displayable objects are identified in an HTML

document by a number of "tags", which specify the attributes of the object, including the

associated URI in the case of hypertext anchors" (Col 6, Lines 58-65). Additionally, "In

step 904, the client system 1 displays these additional Web pages in a sequence,

displaying each Web page for a defined period of time" (Col 7, Lines 44-46).

    The reference discloses that any communication path may be used. Leak fails to

disclose "a broadcast signal including a elementary stream signal which includes a

video stream and an audio stream, and a section signal" for operation in a digital

broadcasting environment. Mao teaches a "a broadcast signal including a elementary

stream signal which includes a video stream and an audio stream, and a section signal"

for operation in a digital broadcasting environment so as "to support a mass quantity of

simultaneous Internet access requests without requiring an excessive number of

simultaneous telephone connections at the remote Internet web site" (Col 3, Lines 14-

17, Also see: Col 6, Lines 14-67, Col 7, Lines 1-18). Consequently, it would have been

obvious to one of ordinary skill in the art to implement Leak with "a broadcast signal

including a elementary stream signal which includes a video stream and an audio

stream, and a section signal" for operation in a digital broadcasting environment for the

stated advantage.

In regard to claim 7, the claimed limitation of "analyzing content information" and

"extracting a plurality of selection items from the content information" is met by the

routine of Figure 9. The "client system 1 initially receives a Web page (i.e., the top level

Web page). The Web page may be received in response to the user of the client system

1 activating a hypertext link in another Web page, for example. In step 902, the client

system 1 identifies URIs that are referred to by the received Web page. As noted above,

the client system 1 is able to identify URIs based on the tags in an HTML document. In

step 903, the client system 1 uses the identified URIs to request and receive each of the

Web pages that are directly linked to the current Web page (i.e., the second level of

Web pages)" (Col 7, Lines 34-44). Further, "In step 904, the client system 1 displays

these additional Web pages in a sequence, displaying each Web page for a defined

period of time. In one embodiment, the period of time is defined based on the content of

the current Web page and is therefore variable" (Col 7, Lines 44-48). The claimed

limitation of "generating an operational procedure for automatically selecting the plurality

of selection items in such a way to output the content information while automatically

selecting the plurality of selection items" is met by Figure 9 and the client system 1 of

Figure 1. The "present invention can be carried out by the CPU 21 executing

sequences of instructions contained in memory (i.e., NVS 22, RAM 23, or a combination

thereof). More specifically, execution of the sequences of instructions causes the CPU

21 to perform the steps of the present invention. Instructions for carrying out the present invention may be loaded into memory from a mass storage device" (Col 5, Lines 6-12). The claimed limitation of "an output device outputting the content information while automatically selecting the plurality of selection items according to the instruction information" is met by the client system 1 of figure 1 and Figure 9. The "client system 1 automatically displays a sequence of Web pages without requiring the user to enter any input once the tour is initiated" (Col 8, Lines 27-30).

Leak discloses that any suitable type of data connection may be used (Col 3, Lines 31-36). Leak fails to disclose "outputting a baseband signal", "selecting an elementary stream..." or a "converting the section signal..." for operation in a digital broadcasting environment. Mao teaches "outputting a baseband signal", "selecting an elementary stream..." and a "converting the section signal..." for operation in a digital broadcasting environment so as "to support a mass quantity of simultaneous Internet access requests without requiring an excessive number of simultaneous telephone connections at the remote Internet web site" (Col 3, Lines 14-17, Also see: Col 8, Lines 5-67, Col 9, Lines 1-50). Consequently, it would have been obvious to one of ordinary skill in the art to implement Leak with "outputting a baseband signal", "selecting an elementary stream..." and a "converting the section signal..." for operation in a digital broadcasting environment for the stated advantage.

In regard to claim 8, the claimed limitation of "a receiving device receiving content information of data broadcasting in digital broadcasting" is met by Figure 4, Item 27 and 29. Modem 27 receives the content information. The reference discloses that

any communication path may be used, which includes digital broadcasting. "Note that

modem 27 may be a conventional telephone modem, an ISDN or Ethernet adapter, or

any other suitable data communication device" (Col 4, Lines 43-46). The claimed

limitation of "generating instruction information for automatically selecting a plurality of

selection items..." is met by Figure 4, Items 21-23. The "present invention can be

carried out by the CPU 21 executing sequences of instructions contained in memory

(i.e., NVS 22, RAM 23, or a combination thereof). More specifically, execution of the

sequences of instructions causes the CPU 21 to perform the steps of the present

invention. Instructions for carrying out the present invention may be loaded into memory

from a mass storage device" (Col 5, Lines 6-12). The claimed limitation of "outputting

the content information...." is met by Figure 9 and the client system 1 of Figure 1. The

"client system 1 automatically displays a sequence of Web pages without requiring the

user to enter any input once the tour is initiated" (Col 8, Lines 27-30).

Leak discloses that any suitable type of data connection may be used (Col 3,

Lines 31-36). Leak fails to disclose "outputting a baseband signal", "selecting an

elementary stream..." or a "converting the section signal..." for operation in a digital

broadcasting environment. Mao teaches a "outputting a baseband signal", "selecting an

elementary stream..." and a "converting the section signal..." for operation in a digital

broadcasting environment so as "to support a mass quantity of simultaneous Internet

access requests without requiring an excessive number of simultaneous telephone

connections at the remote Internet web site" (Col 3, Lines 14-17, Also see: Col 8, Lines

5-67, Col 9, Lines 1-50). Consequently, it would have been obvious to one of ordinary

skill in the art to implement Leak with "outputting a baseband signal", "selecting an

elementary stream..." and a "converting the section signal..." for operation in a digital

broadcasting environment for the stated advantage.

The aforementioned combination fails to explicitly disclose confirming the

outputted content information. However, the examiner takes OFFICIAL NOTICE that is

notoriously well know in the art to confirm outputted content information so as to ensure

that the user is receiving the valid data. Consequently, it would have been obvious to

one of ordinary skill in the art to implement the aforementioned combination confirming

the outputted content information so as to ensure that the user is receiving the valid

data.

In regard to claim 9, the claimed limitation of "receiving means for receiving

content information of data broadcasting in digital broadcasting" is met by Figure 4, Item

27 and 29. Modem 27 receives the content information. The reference discloses that

any communication path may be used, which includes digital broadcasting. "Note that

modem 27 may be a conventional telephone modem, an ISDN or Ethernet adapter, or

any other suitable data communication device" (Col 4, Lines 43-46). The claimed

limitation of "instruction means for generating instruction information to be used to

automatically select a plurality of selection items included in the content information

from the content information" is met by Figure 4, Items 21-23. The "present invention

can be carried out by the CPU 21 executing sequences of instructions contained in

memory (i.e., NVS 22, RAM 23, or a combination thereof). More specifically, execution

of the sequences of instructions causes the CPU 21 to perform the steps of the present

invention. Instructions for carrying out the present invention may be loaded into memory from a mass storage device" (Col 5, Lines 6-12). The claimed limitation of "output means for outputting the content information while automatically selecting the plurality of selection items according to the instruction information" is met by Figure 9 and the client system 1 of Figure 1. The "client system 1 automatically displays a sequence of Web pages without requiring the user to enter any input once the tour is initiated" (Col 8, Lines 27-30).

Leak discloses that any suitable type of data connection may be used (Col 3, Lines 31-36). Leak fails to disclose "outputting a baseband signal", "selection means for selecting an elementary stream..." or a "conversion means for converting the section signal..." for operation in a digital broadcasting environment. Mao teaches a "outputting a baseband signal", "selection means for selecting an elementary stream..." and a "conversion means for converting the section signal..." for operation in a digital broadcasting environment so as "to support a mass quantity of simultaneous Internet access requests without requiring an excessive number of simultaneous telephone connections at the remote Internet web site" (Col 3, Lines 14-17, Also see: Col 8, Lines 5-67, Col 9, Lines 1-50). Consequently, it would have been obvious to one of ordinary skill in the art to implement Leak with "outputting a baseband signal", "selection means for selecting an elementary stream..." and a "conversion means for converting the section signal..." for operation in a digital broadcasting environment for the stated advantage.

In regard to claim 10, the claimed limitation of "generation means for analyzing

content information of data broadcasting in digital broadcasting and generating an

operational procedure for automatically selecting a plurality of selection items included

in the content information" is met by Figure 4, Items 21-23 and the routine of Figure 9.

The "client system 1 automatically displays a sequence of Web pages without requiring

the user to enter any input once the tour is initiated" (Col 8, Lines 27-30). The "client

system 1 initially receives a Web page (i.e., the top level Web page). The Web page

may be received in response to the user of the client system 1 activating a hypertext link

in another Web page, for example. In step 902, the client system 1 identifies URIs that

are referred to by the received Web page. As noted above, the client system 1 is able to

identify URIs based on the tags in an HTML document. In step 903, the client system 1

uses the identified URIs to request and receive each of the Web pages that are directly

linked to the current Web page (i.e., the second level of Web pages)" (Col 7, Lines 34-

44). Additionally, Modem 27 receives the content information. "Note that modem 27

may be a conventional telephone modem, an ISDN or Ethernet adapter, or any other

suitable data communication device" (Col 4, Lines 43-46). The claimed limitations of

"description means for describing information about the operational procedure in the

content information in such a way to output the content information in the operation

procedure" and "output means for outputting content information in which information

about the operational procedure is described" are met by Figure 8. "Each hypertext

anchor in an HTML Web page is associated with a particular URI (Uniform Resource

Identifier), which specifies the location (i.e., logical address) of another Web page or

other data. Hypertext anchors and other displayable objects are identified in an HTML

document by a number of "tags", which specify the attributes of the object, including the

associated URI in the case of hypertext anchors" (Col 6, Lines 58-65). Additionally, "In

step 904, the client system 1 displays these additional Web pages in a sequence,

displaying each Web page for a defined period of time" (Col 7, Lines 44-46).

The reference discloses that any communication path may be used. Leak fails to

disclose "a broadcast signal including a elementary stream signal which includes a

video stream and an audio stream, and a section signal" for operation in a digital

broadcasting environment. Mao teaches a "a broadcast signal including a elementary

stream signal which includes a video stream and an audio stream, and a section signal"

for operation in a digital broadcasting environment so as "to support a mass quantity of

simultaneous Internet access requests without requiring an excessive number of

simultaneous telephone connections at the remote Internet web site" (Col 3, Lines 14-

17, Also see: Col 6, Lines 14-67, Col 7, Lines 1-18). Consequently, it would have been

obvious to one of ordinary skill in the art to implement Leak with "a broadcast signal

including a elementary stream signal which includes a video stream and an audio

stream, and a section signal" for operation in a digital broadcasting environment for the

stated advantage.

In regard to claim 11, the claimed limitation of "analyzing content information of

data broadcasting in digital broadcasting and extracting a plurality of selection items

from the content information" is met by the routine of Figure 9. The "client system 1

initially receives a Web page (i.e., the top level Web page). The Web page may be

received in response to the user of the client system 1 activating a hypertext link in

another Web page, for example. In step 902, the client system 1 identifies URIs that are

referred to by the received Web page. As noted above, the client system 1 is able to

identify URIs based on the tags in an HTML document. In step 903, the client system 1

uses the identified URIs to request and receive each of the Web pages that are directly

linked to the current Web page (i.e., the second level of Web pages)" (Col 7, Lines 34-

44). Further, "In step 904, the client system 1 displays these additional Web pages in a

sequence, displaying each Web page for a defined period of time. In one embodiment,

the period of time is defined based on the content of the current Web page and is

therefore variable" (Col 7, Lines 44-48). The claimed limitation of "generating an

operational procedure for automatically selecting the plurality of selection items in such

a way to output the content information while automatically selecting the plurality of

selection items" is met by Figure 9 and the client system 1 of Figure 1. The "present

invention can be carried out by the CPU 21 executing sequences of instructions

contained in memory (i.e., NVS 22, RAM 23, or a combination thereof). More

specifically, execution of the sequences of instructions causes the CPU 21 to perform

the steps of the present invention. Instructions for carrying out the present invention

may be loaded into memory from a mass storage device" (Col 5, Lines 6-12). The

claimed limitation of "an output device outputting the content information while

automatically selecting the plurality of selection items according to the instruction

information" is met by the client system 1 of figure 1 and Figure 9. The "client system 1

automatically displays a sequence of Web pages without requiring the user to enter any input once the tour is initiated" (Col 8, Lines 27-30).

Leak discloses that any suitable type of data connection may be used (Col 3, Lines 31-36). Leak fails to disclose "outputting a baseband signal", "selecting an elementary stream..." or a "converting the section signal..." for operation in a digital broadcasting environment. Mao teaches a "outputting a baseband signal", "selecting an elementary stream..." and a "converting the section signal..." for operation in a digital broadcasting environment so as "to support a mass quantity of simultaneous Internet access requests without requiring an excessive number of simultaneous telephone connections at the remote Internet web site" (Col 3, Lines 14-17, Also see: Col 8, Lines 5-67, Col 9, Lines 1-50). Consequently, it would have been obvious to one of ordinary skill in the art to implement Leak with "outputting a baseband signal", "selecting an elementary stream..." and a "converting the section signal..." for operation in a digital broadcasting environment for the stated advantage.

Conclusion

4.   Any inquiry concerning this communication or earlier communications from the examiner should be directed to John Manning whose telephone number is 571-272-7352. The examiner can normally be reached on M-F: 9:00 - 5:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, John W. Miller can be reached on 571-272-7353. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the

Patent Application Information Retrieval (PAIR) system. Status information for

published applications may be obtained from either Private PAIR or Public PAIR.

Status information for unpublished applications is available through Private PAIR only.
